128 sounds for the DSI Evolver in Sysex format and as banks for the Soundtower

Evolver Editor -> www.soundtower.com

To transmit the sounds to your Evolver you either need the above mentioned editor or a SysEx tool like MidiOx -> <http://www.midiox.com/>

Warning !

Dumping the file to your Evolver will overwrite the internal sounds in Banks B !

**Please backup *ALL* your own data of the Evolver by Midi Dump to your computer
BEFORE transmitting this soundsset.**

Important:

Do not transmit these sounds if your Evolver isn't connected to a midi keyboard. ALL sounds are programmed to be triggered by midi. If you play them without sending a midi note to the Evolver you will only hear very deep noises ;-) For many of the patches it is recommended to start with notes between C2 and C3.

My Evolver is transposed down by 12 semitones (Row Main / Transpose / -12). I recommend the same settings in order to achieve correctly sounding patches.

All sounds use modulation wheel, aftertouch and pitchbend as modulation sources. The pitchbender is often used to modify other parameters than pitch. Try to use bender, modwheel and aftertouch as often as possible in every possible combination to gain surprising effects ;-)

Have fun

Stefan

Note:

The banks contain a virus that copies a "Jingle bells" patch to all storage places if you use these sounds for more than a year without sending me a short feedback ;-))
